

## Chemically Induced Stress Tests

Also known as	<div><div></div><div><div>1. Adenosine Cardiolite stress test</div><div>2. Dobutamine Cardiolite stress test</div><div>3. Persantine Cardiolite stress test</div></div></div>						
Description	<div>A chemically induced stress test is a type of stress test used when a patient is advised to not exercise on a treadmill. A chemical is injected to produce an effect on the heart similar to exercise and images are taken with the patient lying down.</div>						
See also	<div><div>Similar, related, or easily confused documents.</div><div><div></div><div><div><div>• <a href="#">Cardiac Stress Test</a> - Exercise stress test using a treadmill or a stationary bike.</div><div>• <a href="#">Myocardial Perfusion Imaging (MPI)</a> - A procedure to monitor a patient’s heart. A drug is injected into the patient to simulate the cardiac effect of exercise stress.</div><div>• <a href="#">Nuclear Stress Test</a> - An outpatient test where a small amount of radioactive substance is administered through an IV. A scanning device is used to measure the uptake of the substance by the heart to determine how well blood flows through the heart at rest and during exercise.</div><div>• <a href="#">Stress Echocardiogram</a> - The stress echocardiogram (stress echo) is done before and after a stress electrocardiogram (stress EKG or stress ECG). The stress echo uses echo images (ultrasound) to help assess a patient’s coronary arteries for blockages.</div></div></div></div></div>
